

Probing supermassive compact objects with GRAVITY and the EHT

Frédéric Vincent¹

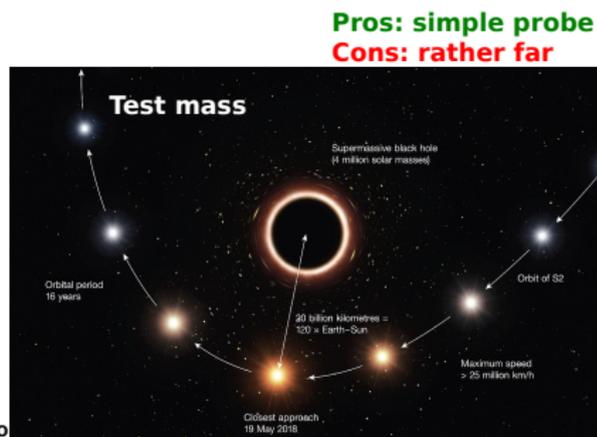

¹CNRS/Observatoire de Paris/LESIA

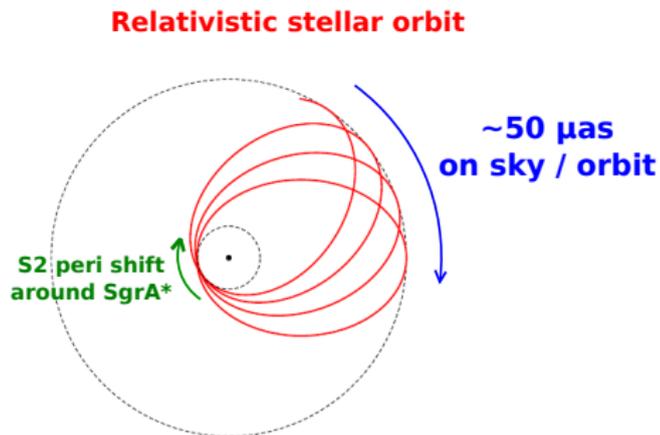

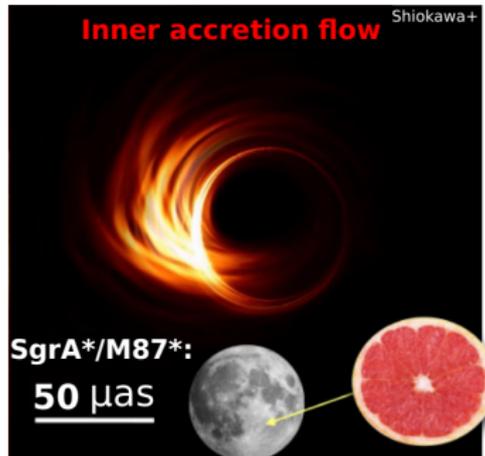

Pros: very close
Cons: very complex

Credit: ESO

Electromagnetic probes of BH surroundings

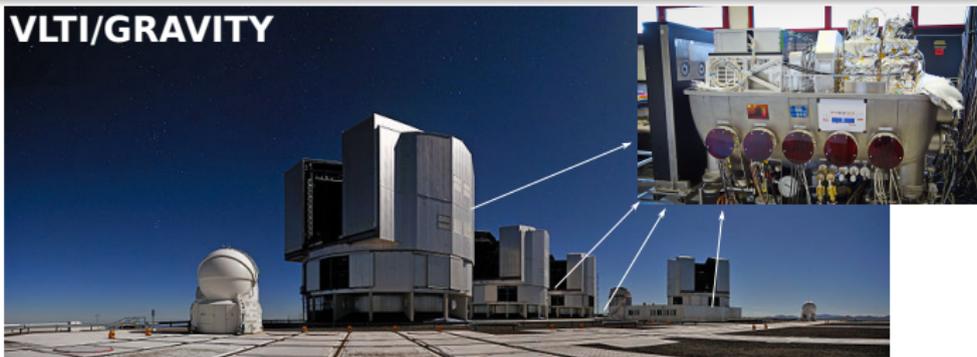

- Star (test mass): clean, but far
- Accretion: close, but astrophysics-poluted

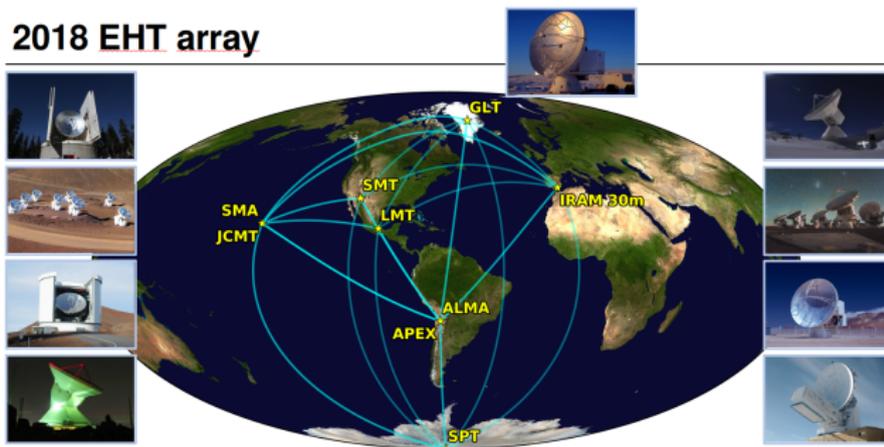

Strong-field test at SgrA*/M87*

- Tens of μas scale astrometry / imaging
- \rightarrow GRAVITY / EHT

VLTI/GRAVITY

2018 EHT array

Testing gravity?

Consistency test

- Using only Kerr
- Check that observables are consistent
- Would also certainly be consistent with non-Kerr spacetimes

Model-comparison test

- Fit data with Kerr and spacetime X
- Show that Kerr is statistically favored
- Big difficulty: degeneracy gravity/astrophysics

**REVOLUTION IN
SCIENCE**

**NEW THEORY OF THE
UNIVERSE.**

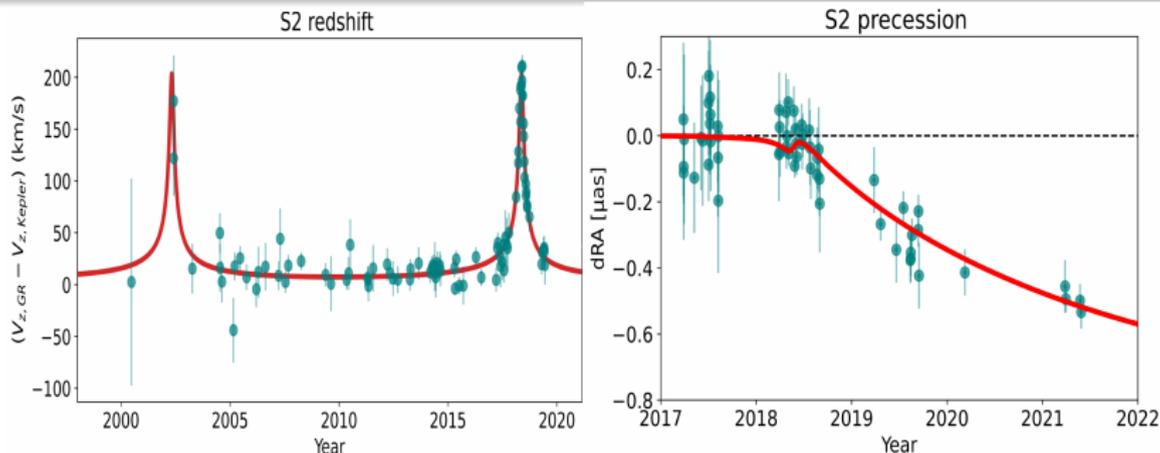

**NEWTONIAN IDEAS
OVERTHROWN.**

Yesterday afternoon in the rooms of the Royal Society, at a joint session of the Royal and Astronomical Societies, the results obtained by British observers of the total solar eclipse of May 29 were discussed.

London Times, Nov 7th 1919

- Eddington's test was a model-comparison one

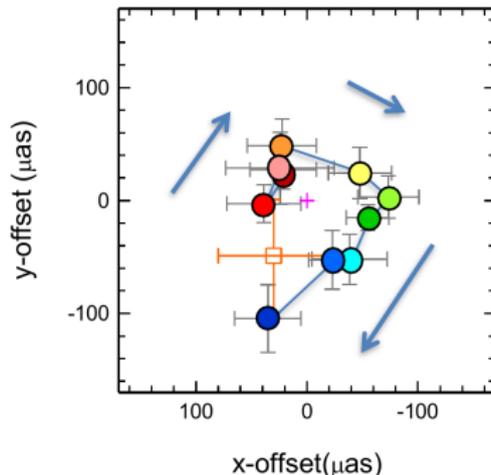

- 1 GRAVITY: stars and flares
- 2 EHT (and future) : inner accretion flow

GRAVITY Collab. 2018a, 2019b, 2020

Redshift / Precession (2018-2021)

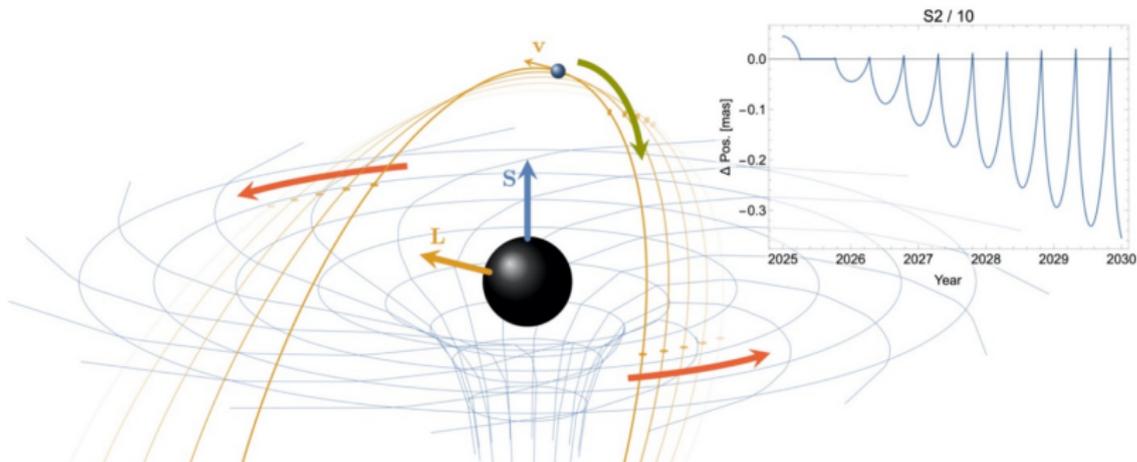

- f -parameter fit: 0 for Newton, 1 for GR (1PN)
- $f_{\text{redshift}} = 1.04 \pm 0.05 \Rightarrow \mathbf{20\sigma}$ grav. redshift detection
compatible results with Keck: Do,Hees,Ghez+19
- $f_{\text{precession}} = 0.997 \pm 0.144 \Rightarrow \mathbf{7\sigma}$ Sch. precession detection
- \rightarrow strong consistency tests of BH paradigm

GRAVITY Collab. 2018b

Orbital motion near horizon (2018)

- Location coincident with Sgr A*
- Compatible with Keplerian motion at $r = 7M$ (compact!)
- Light curve + polarization \Rightarrow low inclination, B poloidal
- \rightarrow strong consistency test of BH paradigm

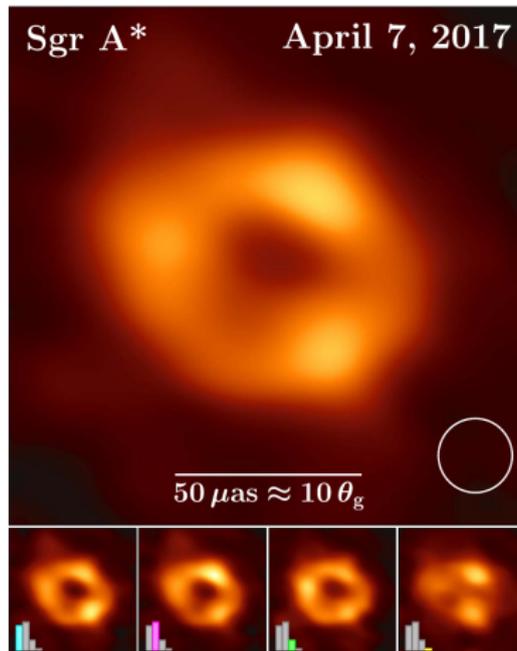

GRAVITY+ Phase A Science Case 2021

Future: GRAVITY+

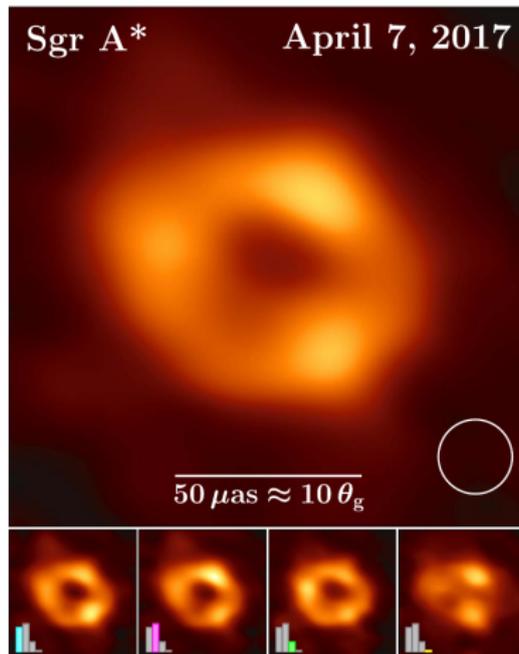

- Go fainter, and closer
- Constrain the **spin!**
- Even further: quadrupole and **no-hair?**
- Can we go from consistency to model-comparison test?

- 1 GRAVITY: stars and flares
- 2 EHT (and future) : inner accretion flow

Event Horizon Telescope Collaboration 2022

- Very interesting for testing the plasma properties
- What about gravity?

Event Horizon Telescope Collaboration 2022

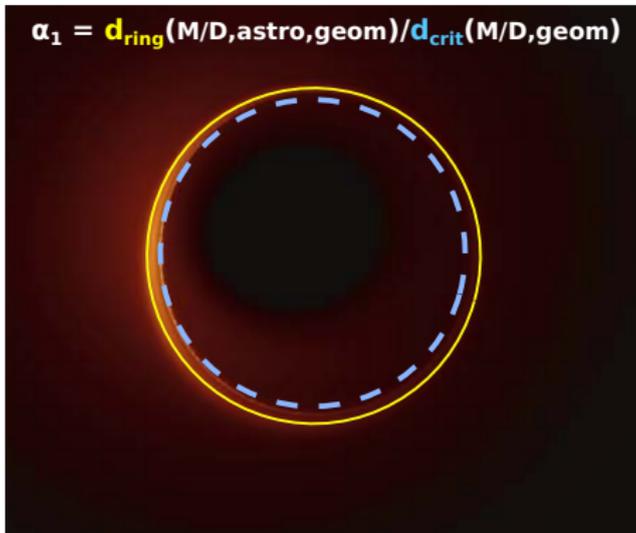

- See talk by **M. Wielgus** tomorrow 11:00, *Denisse room*

Diameter of BH shadow

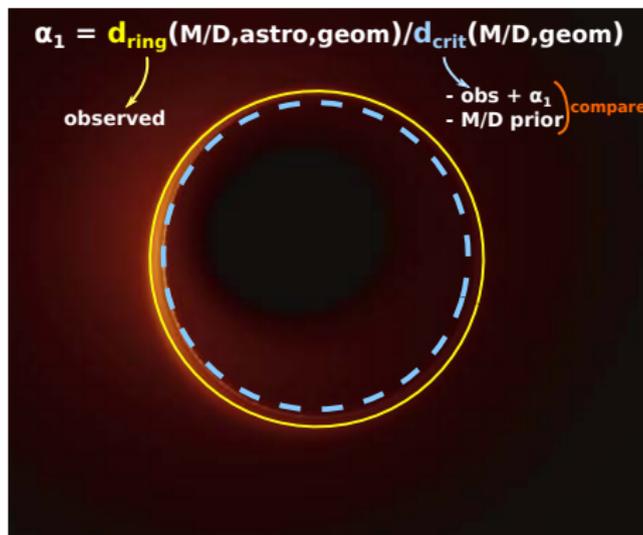

- Scale emission ring to “shadow” (actually, critical curve)
Compare to critical curve given M/D prior
Advocate Kerr consistency test
- Can we trust the GRMHD prediction?

$$\alpha_1 = d_{\text{ring}}(M/D, \text{astro, geom}) / d_{\text{crit}}(M/D, \text{geom})$$

Diameter of BH shadow

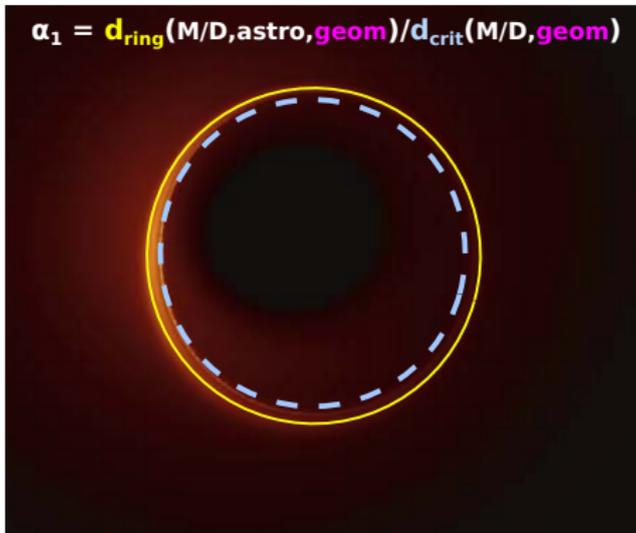

- Scale emission ring to “shadow” (actually, critical curve)
Compare to critical curve given M/D prior
Advocate Kerr consistency test
- Can we trust the GRMHD prediction?

- Scale emission ring to “shadow” (actually, critical curve)
Compare to critical curve given M/D prior
Advocate Kerr consistency test
- Can we trust the GRMHD prediction?
 - → Rather: plasma modeling consistency test

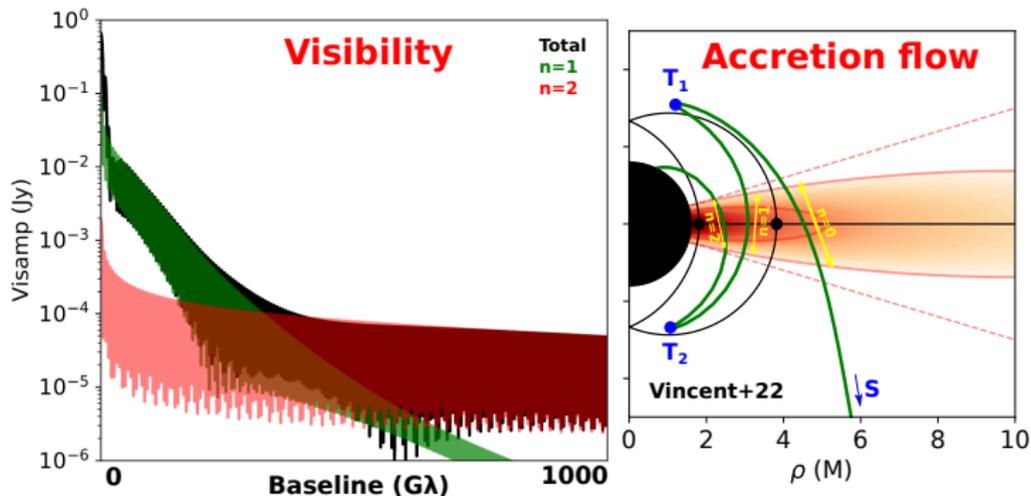

Shadow is astrophysics-dependent

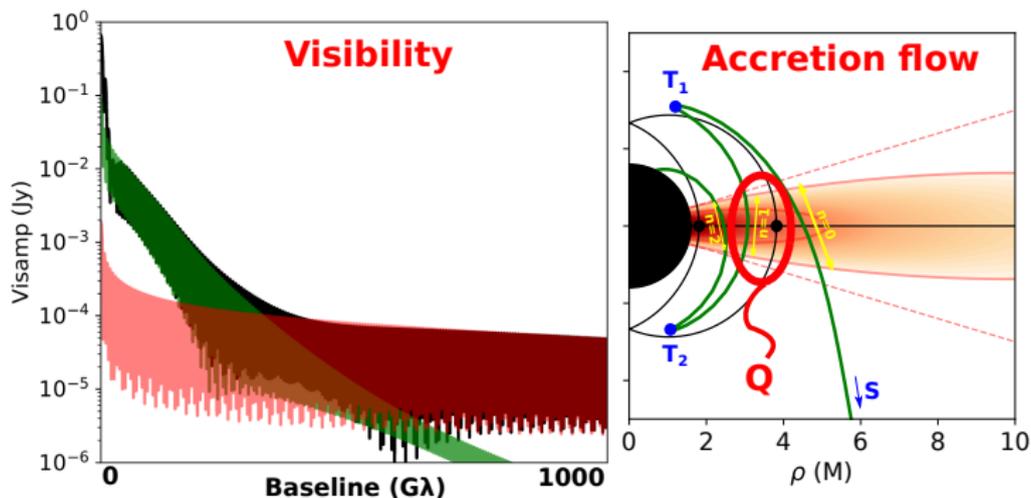

Direct detection of photon rings

- FT(primary + narrow ring): rings dominate at large B
- $n = 2$ ring \approx critical curve \rightarrow BH probe?
- Johnson+2020, Gralla+20 (Kerr consistency test), recent developments: Wielgus21, Paugnat+22, Vincent+22

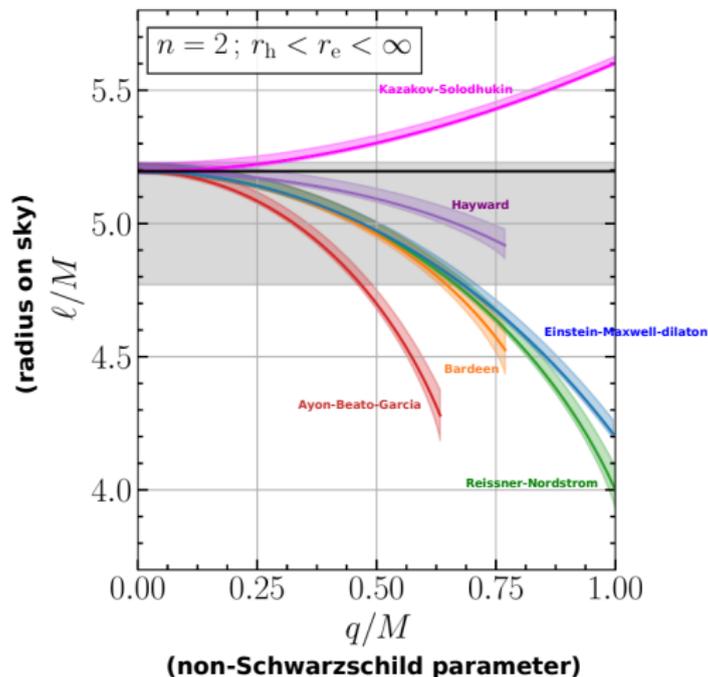

Photon rings Fourier signature

- FT(primary + narrow ring): rings dominate at large B
- $n = 2$ ring \approx critical curve \rightarrow BH probe?
- Johnson+2020, Gralla+20 (Kerr consistency test), recent developments: Wielgus21, Pagnat+22, Vincent+22

Photon rings Fourier signature
